

NGSS Crosscutting concepts: Summary K-2, 3-5

Crosscutting concept	K-2 Crosscutting statements	3-5 Crosscutting statements
<p><b>Patterns</b> Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.</p>	<p>Patterns in the natural and human designed world can be observed, used to describe phenomena, and used as evidence.</p>	<ul style="list-style-type: none"> <li>• Similarities and differences in patterns can be used to sort, classify, and analyze simple rates of change for natural phenomena and designed products.</li> <li>• Patterns of change can be used to make predictions.</li> <li>• Patterns can be used as evidence to support an explanation.</li> </ul>
<p><b>Cause and effect</b> Events have causes, sometimes simple, sometimes multifaceted. Deciphering natural causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.</p>	<ul style="list-style-type: none"> <li>• Events have causes that generate observable patterns.</li> <li>• Simple tests can be designed to gather evidence to support or refute student ideas about causes</li> </ul>	<ul style="list-style-type: none"> <li>• Cause and effect relationships are routinely identified, tested, and used to explain change.</li> <li>• Events that occur together with regularity might or might not be a cause and effect relationship.</li> </ul>
<p><b>Scale, Proportion and Quantity</b> In considering phenomena, it is critical to recognize what is relevant at different measures of size, time, and energy and to recognize how changes in scale, proportion, or quantity affect a system's structure or performance.</p>	<ul style="list-style-type: none"> <li>• Relative scales allow objects and events to be compared and described (e.g., bigger and smaller; hotter and colder; faster and slower)</li> <li>• Standard units are used to measure length.</li> </ul>	<ul style="list-style-type: none"> <li>• Natural objects and/or observable phenomena exist from the very small to the immensely large or from very short to very long time periods.</li> <li>• Standard units are used to measure and describe physical quantities such as weight, time, temperature, and volume.</li> </ul>

Crosscutting concept	K-2 Crosscutting statements	3-5 Crosscutting statements
<p><b>System and System Models</b> A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.</p>	<ul style="list-style-type: none"> <li>• Objects or organisms can be described in terms of their parts.</li> <li>• Systems in the natural and designed world have parts that work together.</li> </ul>	<ul style="list-style-type: none"> <li>• A system is a group of related parts that make up a whole and can carry out functions its individual parts cannot.</li> <li>• A system can be described in terms of its components and its interactions.</li> </ul>
<p><b>Energy and Matter</b> Tracking energy and matter flows, into, out of, and within systems helps one understand the system's behavior.</p>	<ul style="list-style-type: none"> <li>• Objects may break into smaller pieces, be put together into larger pieces, or change shape.</li> </ul>	<ul style="list-style-type: none"> <li>• Matter is made of particles.</li> <li>• Matter flows and cycles can be tracked in terms of the weight of the substance before and after a process occurs. The total weight of the substances does not change. This is what is meant by conservation of matter. Matter is transported into, out of, and within systems.</li> <li>• Energy can be transferred in various ways and between objects.</li> </ul>
<p><b>Structure and Function</b> The way an object is shaped or structured determines many of its properties and functions.</p>	<ul style="list-style-type: none"> <li>• The shape and stability of structures of natural and designed objects are related to their function(s).</li> </ul>	<ul style="list-style-type: none"> <li>• Different materials have different substructures, which can sometimes be observed.</li> <li>• Substructures have shapes and parts that serve functions.</li> </ul>
<p><b>Stability and Change</b> For both designed and natural systems, conditions that affect stability and factors that control rates of change are critical elements to consider and understand.</p>	<ul style="list-style-type: none"> <li>• Some things stay the same while other things change.</li> <li>• Things may change slowly or rapidly.</li> </ul>	<ul style="list-style-type: none"> <li>• Change is measured in terms of differences over time and may occur at different rates.</li> <li>• Some systems appear stable, but over long periods of time will eventually change.</li> </ul>
